Paper 2

October/November 2023

2 hours

You must answer on the question paper.

No additional materials are needed.

INSTRUCTIONS

- Answer **all** questions.
- Use a black or dark blue pen. You may use an HB pencil for any diagrams or graphs.
- Write your name, centre number and candidate number in the boxes at the top of the page.
- Write your answer to each question in the space provided.
- Do **not** use an erasable pen or correction fluid.
- Do **not** write on any bar codes.
- You should use a calculator where appropriate.
- You must show all necessary working clearly; no marks will be given for unsupported answers from a calculator.
- Give non-exact numerical answers correct to 3 significant figures, or 1 decimal place for angles in degrees, unless a different level of accuracy is specified in the question.

INFORMATION

- The total mark for this paper is 80.
- The number of marks for each question or part question is shown in brackets [].

This document has **16** pages. Any blank pages are indicated.

- 1 (a) A straight line passes through the points $(4, 23)$ and $(-8, 29)$. Find the point of intersection, P , of this line with the line $y = 2x + 5$. [5]

- (b) Find the distance of P from the origin. [2]

- 2 Find the non-zero value of k for which the line $y = -2x - 6k - 1$ is a tangent to the curve $y = x(x + 2k)$. [5]

3 DO NOT USE A CALCULATOR IN THIS QUESTION.

A cylinder has base radius $(2 + \sqrt{3})$ m and volume $\pi(16 + 9\sqrt{3})\text{m}^3$. Find the exact value of its height, giving your answer in its simplest form. [4]

4 Solve the following equations.

(a) $\frac{(e^{x+1})^2}{\sqrt{e^x}} = 10$

[4]

(b) $2 \log_9 y - \log_9(4y - 9) = \frac{1}{2}$

[5]

- 5 (a) Find the equation of the normal to the curve $y = x^3 - 7x^2 + 12x - 5$ at the point (1, 1). [5]

- (b) Find the x -coordinates of the two points where the normal cuts the curve again. Give your answers in the form $x = a \pm \sqrt{b}$ where a and b are integers. [5]

6 Find the exact value of $\int_2^3 \frac{(x+2)^2}{x} dx$.

[6]

7 A particle is travelling in a straight line. Its displacement, s metres, from the origin at time t seconds is given by $s = 1.5e^{2t} + 2e^{-2t} - t$.

(a) Find expressions for the velocity, $v \text{ ms}^{-1}$, and acceleration, $a \text{ ms}^{-2}$, of the particle. [3]

(b) Find the time, T seconds, when the particle is at rest. [4]

(c) Find the acceleration of the particle at time T seconds. [2]

8 A curve has equation $y = x \sin 2x$.

(a) Find $\frac{dy}{dx}$.

[2]

(b) Find the equation of the tangent to the curve at $x = \frac{\pi}{4}$.

[3]

- (c) Use your answer to **part (a)** to find the exact value of $\int_0^{\frac{\pi}{6}} 2x \cos 2x dx$. [5]

- 9 (a) An arithmetic progression has twelve terms. The sum of the first three terms is -36 and the sum of the last three terms is 72 . Find the first term and the common difference. [5]

- (b) The first three terms of a geometric progression are 1 , 1.2 and 1.44 . Find the smallest value of n such that the sum of the first n terms is greater than 500 . [5]

10 (a) By writing $\cot x$ and $\tan x$ in terms of $\cos x$ and $\sin x$, show that

$$\frac{\sin x}{1 - \cot x} + \frac{\cos x}{1 - \tan x} = \sin x + \cos x.$$

[5]

(b) Solve the equation $9 \cot x + 3 \operatorname{cosec} x = \tan x$, for $0^\circ < x < 360^\circ$.

[5]
